Activities during Object Modeling

Main goal: Find the important abstractions

• Steps during object modeling
  - Class identification
    - Based on the fundamental assumption that we can find abstractions
  2. Find the attributes
  3. Find the methods
  4. Find the associations between classes

• Order of steps
  - Goal: get the desired abstractions
  - Order of steps secondary, only a heuristic

• What happens if we find the wrong abstractions?
  - We iterate and revise the model
Class Identification

Class identification is crucial to object-oriented modeling
• Helps to identify the important entities of a system

• Basic assumption:
  • 1. We can find the classes for a new software system (Forward Engineering)
  • 2. We can identify the classes in an existing system (Reverse Engineering)

• Why can we do this?
  • Philosophy, science, experimental evidence
Class identification is an ancient problem

- Objects are not just found by taking a picture of a scene or domain
- The application domain has to be analyzed.
- Depending on the purpose of the system different objects might be found
  - How can we identify the purpose of a system?
  - Scenarios and use cases
- Another important problem: Define system boundary.
  - What object is inside, what object is outside?
What is This?
What is This?

Modeling in Action

- Face
- Sad
- Happy
- Is it one Face or two?
- Mask
- Who is using it?
  - Person at Carneval?
  - Bank robber?
  - Painting collector
- How is it used?
Pieces of an Object Model

• Classes
• Associations (Relations)
• Attributes
• Operations
Associations

• Types of Associations
  • Canonical associations
    • Part-of Hierarchy (Aggregation)
    • Kind-of Hierarchy (Inheritance)
  • Generic associations
Attributes

• Detection of attributes is application specific
• Attributes in one system can be classes in another system
• Turning attributes to classes and vice versa
Operations

• Source of operations
  • Use cases in the functional model
  • General world knowledge
  • Generic operations: Get/Set
  • Design Patterns
  • Application domain specific operations
  • Actions and activities in the dynamic model
Object vs Class

- Object (instance): Exactly one thing
  - This lecture on object modeling
- A class describes a group of objects with similar properties
  - Game, Tournament, mechanic, car, database
- Object diagram: A graphical notation for modeling objects, classes and their relationships
  - Class diagram: Template for describing many instances of data. Useful for taxonomies, patterns, schemata...
  - Instance diagram: A particular set of objects relating to each other. Useful for discussing scenarios, test cases and examples
Class Identification

• Approaches
  • Application domain approach
    • Ask application domain experts to identify relevant abstractions
  • Syntactic approach
    • Start with use cases
    • Analyze the text to identify the objects
    • Extract participating objects from flow of events
  • Design patterns approach
    • Use reusable design patterns
  • Component-based approach
    • Identify existing solution classes.
There are different types of Objects

- **Entity Objects**
  - Represent the persistent information tracked by the system (Application domain objects, also called “Business objects”)

- **Boundary Objects**
  - Represent the interaction between the user and the system

- **Control Objects**
  - Represent the control tasks performed by the system.
Example: 2BWatch Modeling

To distinguish these different object types in the model we can use the UML Stereotype mechanism.
Naming Object Types in UML

- UML provides the stereotype mechanism to introduce new types of modeling elements
- UML is an extensible language

Entity Objects: <<Entity>> Year, <<Entity>> Month, <<Entity>> Day
Control Objects: <<Control>> ChangeDate
Boundary Objects: <<Boundary>> Button, <<Boundary>> LCDDisplay
Object Types and Change 11 21 2006

• Having three types of object leads to models that are more resilient to change
  • The interface of a system changes more likely than the control
  • The way the system is controlled changes more likely than the application domain

• Object types originated in Smalltalk:
  • Model, View, Controller (MVC)
  • Entity, Boundary, Control Objects

• Next topic: Finding objects.
Finding Participating Objects in Use Cases

• Pick a use case and look at flow of events
  • Do a textual analysis (noun-verb analysis)
    • Nouns are candidates for objects/classes
    • Verbs are candidates for operations
    • Also called Abbott’s Technique

• After objects/classes are found, identify their types
  • Identify real world entities that the system needs to keep track of (FieldOfficer → entity object)
  • Identify real world procedures that the system needs to keep track of (EmergencyPlan → control object)
  • Identify interface artifacts (PoliceStation → boundary object)
Example for using the Technique

Flow of Events:

• The customer enters the store to buy a toy.
• It has to be a toy that his daughter likes and it must cost less than 50 Euro.
• He tries a videogame, which uses a data glove and a head-mounted display. He likes it.
• An assistant helps him.
• The suitability of the game depends on the age of the child.
• His daughter is only 3 years old.
• The assistant recommends another type of toy, namely the boardgame “Monopoly”.
Mapping parts of speech to model components (Abbot’s Technique)

<table>
<thead>
<tr>
<th>Example</th>
<th>Part of speech</th>
<th>Model component</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Monopoly”</td>
<td>Proper noun</td>
<td>object</td>
</tr>
<tr>
<td>Toy</td>
<td>Improper noun</td>
<td>class</td>
</tr>
<tr>
<td>Buy, recommend</td>
<td>Doing verb</td>
<td>operation</td>
</tr>
<tr>
<td>is-a</td>
<td>being verb</td>
<td>inheritance</td>
</tr>
<tr>
<td>has an</td>
<td>having verb</td>
<td>aggregation</td>
</tr>
<tr>
<td>must be</td>
<td>modal verb</td>
<td>constraint</td>
</tr>
<tr>
<td>dangerous</td>
<td>adjective</td>
<td>attribute</td>
</tr>
<tr>
<td>enter</td>
<td>transitive verb</td>
<td>operation</td>
</tr>
<tr>
<td>depends on</td>
<td>intransitive verb</td>
<td>Constraint, class, association</td>
</tr>
</tbody>
</table>
The customer enters the store to buy a toy. It has to be a toy that his daughter likes and it must cost less than 50 Euro. He tries a videogame, which uses a data glove and a head-mounted display. He likes it.

An assistant helps him. The suitability of the game depends on the age of the child. His daughter is only 3 years old. The assistant recommends another type of toy, namely a boardgame. The customer buy the game and leaves the store.
Ways to find Objects

• Syntactical investigation with Abbot's technique:
  • Flow of events in use cases
  • Problem statement

• Use other knowledge sources:
  • Application knowledge: End users and experts know the abstractions of the application domain
  • Design knowledge: Abstractions in the solution domain
  • General world knowledge: Your generic knowledge and intuition
Order of Activities for Object Identification

1. Formulate a few scenarios with help from an end user or application domain expert

2. Extract the use cases from the scenarios, with the help of an application domain expert

3. Then proceed in parallel with the following:
   • Analyse the flow of events in each use case using Abbot's textual analysis technique
   • Generate the UML class diagram.
Steps in Generating Class Diagrams

• Class identification (textual analysis, domain experts)
• Identification of attributes and operations (sometimes before the classes are found!)
• Identification of associations between classes
• Identification of multiplicities
• Identification of roles
• Identification of inheritance
Who uses Class Diagrams?

• Purpose of class diagrams
  • The description of the static properties of a system

• The main users of class diagrams:
  • The application domain expert
    • uses class diagrams to model the application domain (including taxonomies)
    • during requirements elicitation and analysis
  • The developer
    • uses class diagrams during the development of a system
    • during analysis, system design, object design and implementation.
Who does not use Class Diagrams?

- The **client** and the **end user** are often not interested in class diagrams
  - Clients usually focus more on project management issues
  - End users usually focus on the functionality of the system.
Developers have different Views on Class Diagrams

• According to the development activity, a developer plays different roles:
  • Analyst
  • System Designer
  • Object Designer
  • Implementor

• Each of these roles has a different view about the class diagram (the object model).
The View of the Analyst

• The analyst is interested
  • in application classes: The associations between classes are relationships between abstractions in the application domain
  • operations and attributes of the application classes (difference to E/R models!)

• The analyst uses inheritance in the model to reflect the taxonomies in the application domain
  • Taxonomy: An is-a-hierarchy of abstractions in an application domain

• The analyst is not interested
  • in the exact signature of operations
  • in solution domain classes
The View of the Designer

- The **designer** focuses on the solution of the problem, that is, the solution domain
- The **associations between classes** are now references (pointers) between classes in the application or solution domain
- An important design task is the specification of interfaces:
  - The designer describes the interface of classes and the interface of subsystems
  - Subsystems originate from modules (term often used during analysis):
    - **Module**: a collection of classes
    - **Subsystem**: a collection of classes with an interface
- Subsystems are modeled in UML with a package.
Goals of the Designer

• The most important design goals for the designer are design usability and design reusability

• **Design usability**: the interfaces are usable from as many classes as possible within in the system

• **Design reusability**: The interfaces are designed in a way, that they can also be reused by other (future) software systems
  
  => Class libraries
  => Frameworks
  => Design patterns.
The View of the Implementor

• **Class implementor**
  • Must realize the interface of a class in a programming language
  • Interested in appropriate data structures (for the attributes) and algorithms (for the operations)

• **Class extender**
  • Interested in how to extend a class to solve a new problem or to adapt to a change in the application domain

• **Class user**
  • The class user is interested in the signatures of the class operations and conditions, under which they can be invoked
  • The class user is not interested in the implementation of the class.
Why do we distinguish different Users of Class Diagrams?

- Models often don’t distinguish between application classes and solution classes
  
  **Reason**: Modeling languages like UML allow the use of both types of classes in the same model
  
  **Preferred**: No solution classes in the analysis model

- Many systems don’t distinguish between the specification and the implementation of a class
  
  **Reason**: Object-oriented programming languages allow the simultaneous use of specification and implementation of a class

  **Preferred**: We distinguish between analysis model and object design model. The analysis design model does not contain any implementation specification.
Analysis model vs. object design model

• The analysis model is constructed during the analysis phase
  • Main stake holders: End user, customer, analyst
  • The class diagrams contains only application domain classes

• The object design model (sometimes also called specification model) is created during the object design phase
  • Main stake holders: class specifiers, class implementors, class users and class extenders
  • The class diagrams contain application domain as well as solution domain classes.
Analysis model vs object design model (2)

• The analysis model is the basis for communication between analysts, application domain experts and end users.

• The object design model is the basis for communication between designers and implementors.
Summary

• System modeling
  • Functional model, object model, dynamic model
• From scenarios to use cases to objects
• Object modeling is the central activity
  • Class identification is a major activity of object modeling
  • Easy syntactic rules to find classes and objects
  • Abbot’s Technique
• Analysts, designers and implementors have different modeling needs
  • There are three types of implementors with different roles during
    • Class user, class implementor, class extender.
